ADVANCED IMAGE

Advanced Image will expand on the technical skills and concept development learned in the Image class. In this course, we’ll explore photography and videography via projects, readings, and in-class discussions, with a focus on how these mediums are used in the arts. Students will gain hands-on technical experience working with DSLR cameras, lighting equipment, Photoshop, and Premiere. They will also be introduced to art theory and asked to create projects that combine technical skills with conceptual thinking.

Class topics and projects will include the use of wearable cameras and drone photography, the use of green screens, Virtual Reality, scanner art, and glitching. The class will also discuss such concepts as the work of contemporary artists, photo and video history, and art theory. Through this class, students will gain a more advanced set of camera and digital skills, and a growing understanding of how to create conceptual photographic and video imagery.
